

*Leibniz was the first to
understand “e” as base of the natural logarithm
and calculate its value accurately: 2.7182818.*

First International Virtual Symposium Honoring
the “Eulerian” Number $e = 2.71828\dots$

February 7, 18:28 Amsterdam time
California 9:28 a.m. pst

Michael Raugh	auranteacus@gmail.com

*Leibniz solved the **Catenary Problem** using calculus,
BUT he presented it as a **geometric construction**.*

The value of e was needed for the construction.

Based on:

“The Leibniz catenary and approximation of e — an analysis of
his unpublished calculations,” Hist. Math. (2019),

<https://doi.org/10.1016/j.hm.2019.06.001>,

and presentations at:

<http://mikeraugh.org>.

*Catenaries under the **Pink Moon***

Upside Down and 631 Feet High

The Gateway Arch, St. Louis, Missouri

Context

1638, Galileo discussed the hanging chain.

1676, Newton and Leibniz derived the non-constant terms of the exponential series, omitting the constant 1.

1690, Jacob Bernoulli published the challenge.

1691, Leibniz and *Johann* Bernoulli published the first solutions.

1761, J.H. Lambert introduced the hyperbolic functions:

$$\cosh x = \frac{e^x + e^{-x}}{2} \quad \sinh x = \frac{e^x - e^{-x}}{2}$$

Descartes: A curve must be defined by a construction.

Leibniz published a geometric construction, but concealed its discovery by calculus.

He explained the derivation in a private letter to Rudolph von Bodenhausen but only stated the key ratio $1 : 2.7182818$.

“Let those who don’t know the new analysis try their luck!”

His hidden method of computation was found at the GWLB among his private papers.

And so our story begins with Part 1....Construction

*Leibniz's Representation of the Catenary:
Ruler & Compass, K & D*

Constructing the “Logarithmic Curve”

Ordinates over **N & O** and **O & (N)** are in ratio **K:D**.
Middling ordinates are determined by geometric means.

Construction of the “Catenary”

$$C(x) = \frac{r^x + r^{-x}}{2}, \quad r = \frac{d}{k}$$

Two Examples to Prove that $d/k = e$

Segment \overline{AR} is equal in length to arc \widehat{CA} .

Tangent at (C) follows from fact that $\angle b$ is the complement of $\angle a$.

$$(y = \cosh x)$$

The letter to Von Bodenhause

He explained how he solved $dy = \frac{d\omega}{\omega}$:

Rudolf Christian Von Bodenhause, August 1691, with attached Latin text, “Analysis problematis catenarii”, in G. W. Leibniz, *Sämtliche Schriften und Briefe*, series III, volume 5 (2003), p. 143-155.

He did not say how he found,
2.7182818.

Part 2 will tell that story.....Calculation

Leibniz wrote his calculations on two sides of one sheet

(To see manuscript images courtesy of the GWLB:

Side 2 of Leibniz's Worksheet: Using e , $1/e$

List of Reciprocal Factorials (Side 1)

A handwritten table of reciprocal factorials on aged, yellowed paper. The table lists values for $1/n!$ for n from 1 to 14. The entries are written in cursive and include some corrections and annotations. The values are as follows:

n	$1/n!$
1	$1 = \frac{1}{1}$
2	$\frac{1}{2} = 0.5$
3	$\frac{1}{2 \cdot 3} = 0.16666666666666666$
4	$\frac{1}{2 \cdot 3 \cdot 4} = 0.04166666666666667$
5	$\frac{1}{2 \cdot 3 \cdot 4 \cdot 5} = 0.00833333333333333$
6	$\frac{1}{2 \cdot 3 \cdot 4 \cdot 5 \cdot 6} = 0.00138888888888889$
7	$\frac{1}{2 \cdot 3 \cdot 4 \cdot 5 \cdot 6 \cdot 7} = 0.00023809523809524$
8	$\frac{1}{2 \cdot 3 \cdot 4 \cdot 5 \cdot 6 \cdot 7 \cdot 8} = 0.0000375$
9	$\frac{1}{2 \cdot 3 \cdot 4 \cdot 5 \cdot 6 \cdot 7 \cdot 8 \cdot 9} = 0.00000555555555556$
10	$\frac{1}{2 \cdot 3 \cdot 4 \cdot 5 \cdot 6 \cdot 7 \cdot 8 \cdot 9 \cdot 10} = 0.00000055555555556$
11	$\frac{1}{2 \cdot 3 \cdot 4 \cdot 5 \cdot 6 \cdot 7 \cdot 8 \cdot 9 \cdot 10 \cdot 11} = 0.00000005555555556$
12	$\frac{1}{2 \cdot 3 \cdot 4 \cdot 5 \cdot 6 \cdot 7 \cdot 8 \cdot 9 \cdot 10 \cdot 11 \cdot 12} = 0.0000000055555555556$
13	$\frac{1}{2 \cdot 3 \cdot 4 \cdot 5 \cdot 6 \cdot 7 \cdot 8 \cdot 9 \cdot 10 \cdot 11 \cdot 12 \cdot 13} = 0.000000000555555555556$
14	$\frac{1}{2 \cdot 3 \cdot 4 \cdot 5 \cdot 6 \cdot 7 \cdot 8 \cdot 9 \cdot 10 \cdot 11 \cdot 12 \cdot 13 \cdot 14} = 0.0000000000555555555556$

Annotations and corrections include:

- Handwritten corrections of digits in the decimal expansions.
- A note "et error" in the top right corner.
- A note "1000000" near the bottom right.
- A note "1/100" near the bottom right.
- A note "1/100" near the bottom right.
- A note "1/100" near the bottom right.

Reciprocals used to estimate e and $1/e$ (Side 1)

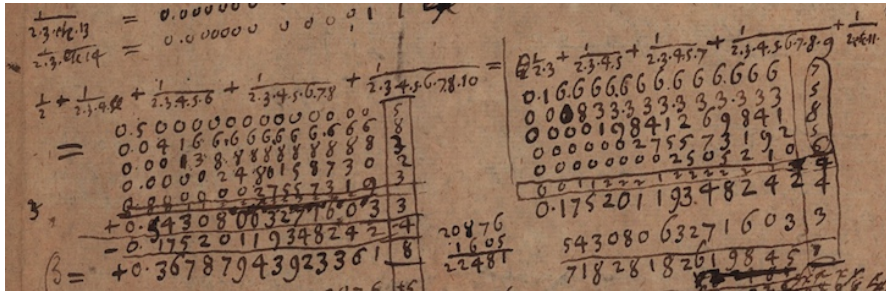

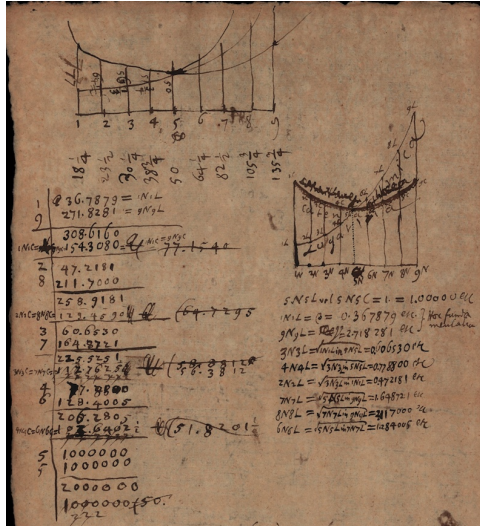

Figure: Reciprocals 1 to $1/11!$, even numbers and odd numbers, added or subtracted, yield estimates for e and $1/e$. The digits 20876 and 1605 are misplaced in decimal representations for $1/12!$ and $1/13!$, invalidating attempt to improve results.

Cumulative Sums (plus +2) Reveal Convergence to e.
Did Leibniz do this?

- [illegible]

Construction: the Exponential Curve and Catenary (Side 2)

Drawing and Instructions for the Engraver
